Current State of Affairs

- **QD3D v1.5 Shipped 11/96**
 - Won Comdex's Best of Show
 - First big step towards extensibility
 - Plug-in Rendering
 - Plug-in Groups
 - First version to showcase cross-platform (Win95/NT)
 - Simultaneous release and features
 - Uses native Windows 95/NT services

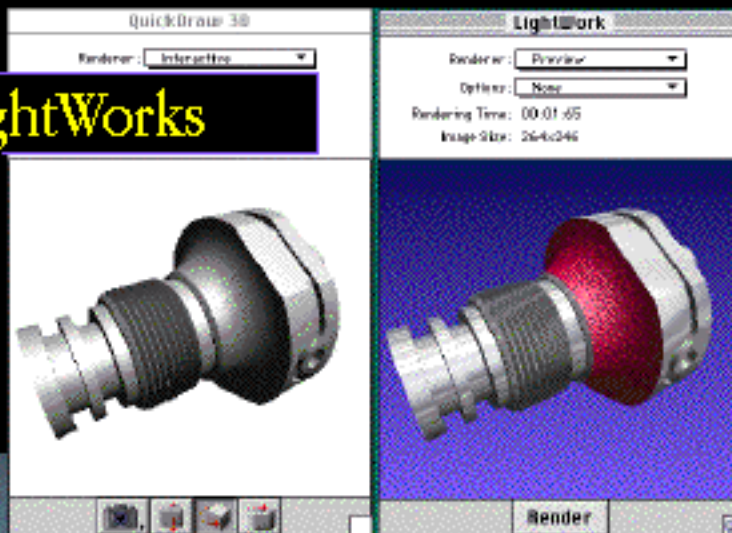

QuickDraw 3D Defined

Plug-In Rendering

LightWorks

3Dfx for the Mac Platform

- 3Dfx and Apple are working together to bring you this technology
- Commercial hardware products will be available shortly—contact Apple and the OEM suppliers
- 3Dfx is working closely with publishers and game developers—Interplay/Macsoft, GT Interactive
- We are actively seeking Internet and content creation applications developers
- Contact us!
 - Email: devprogram@3dfx.com
 - Web: <http://www.3dfx.com>
 - Phone: (888) FOR3DFX

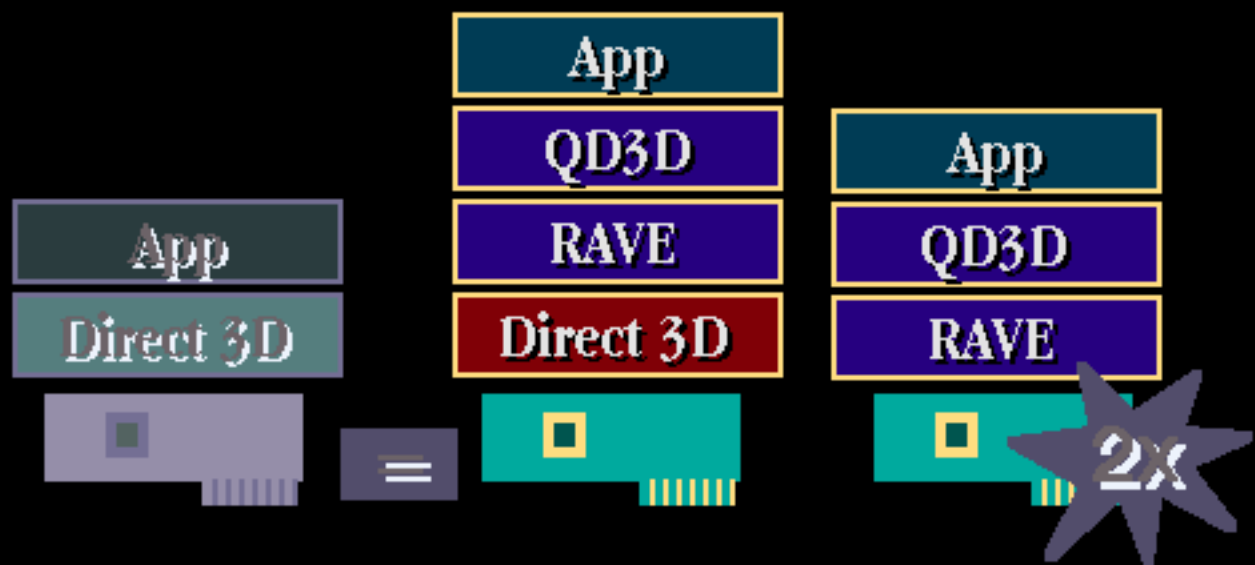

QuickDraw 3D on Windows

- Uses native file I/O
- Uses native draw context
- Will be able to use RAVE or Direct3D to access hardware acceleration

QuickDraw 3D on Windows

- Uses native file I/O
- Uses native draw context
- Will be able to use RAVE or Direct3D to access hardware acceleration

QuickDraw 3D and Rhapsody

- **Blue Box (Sys.7.x)**
 - QD3D will work without change
- **Yellow Box (OpenStep)**
 - Will be ported to support OpenStep APIs

What's Next?

- QD3D v.1.6–Q4 1997
 - Performance release
 - VRML 2.0 Rendering Compliance
 - 1st Draft of Shader Interface
- QD3D v2.0
 - Shader Interface Implementation
 - Next Generation H/W Abstraction Layer

Making QuickDraw 3D Internet Savvy

- **QD3D Netscape plug-in**
 - Allows for Drag & Drop from WWW to application
- **3DMF**
 - File references
- **Adding Walkthrough Mode in QD3D Viewer**
- **Enabling Plug-in Rendering**
 - Cartoon Interactive Rendering
 - BSP Rendering

How Is VRML and the Macintosh Viewed Today?

- **Apple Missing From VRML playing field**
- **No Shipping VRML Browsers**
- **No VRML 2.0 Authoring Tools**

How Will We Change this Problem?

- **Apple has a seat on VRML Board**
- **Creating alliances with
Third-Party Vendors**
- **Fixing and adding new technologies
to QuickDraw 3D**

Key VRML 2.0 Partnerships Announced

- **Apple, IBM and Paragraph**
 - VRML 2.0 Binary Collaboration
 - Smaller
 - Faster
 - Geometry Compression
- **Silicon Graphics**
 - Apple to License VRML 2.0, Browser CosmoPlayer
 - Looking to partner further on VRML Technologies

Third-Party VRML Browsers and Authoring Tools

- **Intervista**
 - C based VRML Browser—WorldViewer
 - www.intervista.com
- **Dimension-X**
 - JAVA based VRML Browser—LiquidReality
 - www.dimension-X.com
- **Paragraph**
 - VRML Authoring Tool—
VisualSpaceHomeBuilder (VSHB)
 - www.paragraph.com

QuickDraw™ 3D 1.5 and 1.5.1

Philip Schneider

QuickDraw 3D
Technical Lead

Introduction

Where to get started

- **First steps**
- **Develop articles**
 - See
<http://devworld.apple.com/dev/toc.shtml>
- **Debugging**

Basic Components of a QuickDraw 3D Application

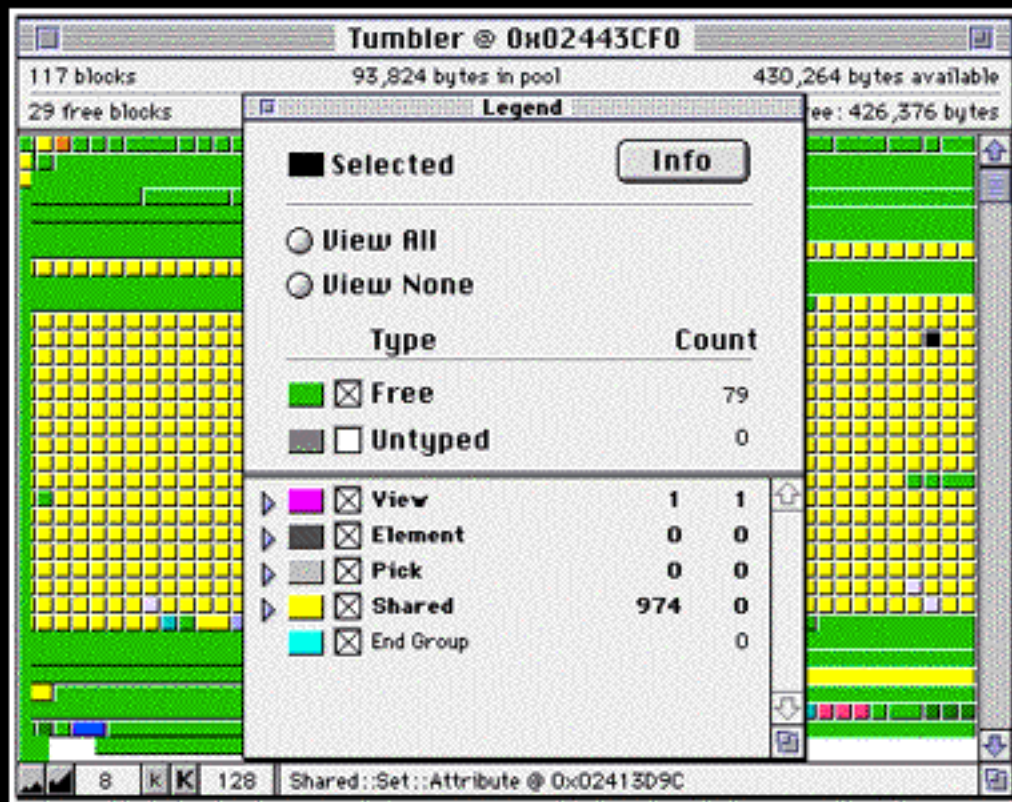

First steps...

- **View**
 - Camera
 - Lights
 - Draw Context
 - Renderer
- **Geometries, Transforms, Styles etc.**
- **For a good introduction to the basics see: “QuickDraw 3D: A New Dimension for Macintosh Graphics” in *develop* Issue 22**

Debugging QuickDraw 3D Applications

- Use the debug version of the library
- Use 3Debug to look at memory usage

QuickDraw 3D on Windows

- Uses native file I/O
- Uses native draw contexts
- Windows-native Viewer provided
- Will be able to use RAVE to access hardware acceleration (via D3D Engine)

App

QD3D

RAVE

RAVE Engine

QuickDraw 3D on Windows 95/NT

- **Cross-platform by design—only 3 platform-specific objects**
 - Two Windows-specific draw contexts (interface to Windows system)
 - Windows-specific storage object

Windows 95/NT...

- **Win32DC draw context**
 - Compatible with existing code base using DCs
 - Must use CS_OWNDC window class style

```
typedef struct TQ3Win32DCDrawContextData {  
    TQ3DrawContextData    drawContextData;  
    HDC                    hdc;  
} TQ3Win32DCDrawContextData;
```

...Windows 95/NT

- **DDSurface draw context**
 - Can take advantage of 2D hardware acceleration for double-buffering and clearing
 - Requires more setup, but more flexible

```
typedef struct TQ3DDSurfaceDrawContextData {  
    TQ3DrawContextData    drawContextData;  
    TQ3DDSurfaceDescriptor ddSurfaceDescriptor;  
} TQ3DDSurfaceDrawContextData;
```

Windows 95 and Windows NT

Screen Shot of QD3D Viewer

Plug-In Extensibility

- **Plug-ins can be used to extend the functionality of QuickDraw 3D**
- **In 1.5 the following types of plug-ins are supported**
 - **Elements/Attributes**
 - **Groups**
 - **Renderers**
- **Support for plug-in shaders will be forthcoming**

Commonality

- **Loading/Initialization**
 - On Mac OS this is handled by CFM
 - On Windows by the DLL loader
 - You need to supply a registration function
- **Metahandler**
 - Method dispatcher for the plug-in class
- **Termination**

Plug-In Renderers

- **3 Steps to build a QD3D Plug-in Renderer**
 - Register
 - Top Level Metahandler
 - 2nd Level MetaHandler
- **Renderers are pretty involved in general, sample renderers and documentation provided on SDK**
- **QuickDraw 3D provides a mechanism for packaging a new or existing renderer**

Metahandler

The plug-in method dispatcher

- Each class of plug-in has a set of methods that get called via the metahandler
- These methods vary depending on whether your plug-in class is
 - An Element or Attribute, a Group, or a Renderer
- The method handler is essentially a big switch statement, returning (usually) function pointers

Elements and Attributes

- See `develop` Issue 26
- What's the difference between them?
 - Attributes can be inherited, elements are not
- There is a sample plug-in attribute on the SDK
- You should be migrating your attributes and elements to be plug-ins if you need to share them with other developers

Name Space Changes

Changes from develop and the Book

- If you are reading the documentation for attributes note that the name space is altered
 - “X” is added to extensibility names
- Some examples:

`TQ3FunctionPointer` → `TQ3XFunctionPointer`

`Q3View_SubmitWriteData` → `Q3XView_SubmitWriteData`

`kQ3MethodTypeObjectTraverse` → `kQ3XMethodTypeObjectTraverse`

Geometric Primitives

- **Simple**
 - Point, Line, PolyLine, Triangle, Polygon, General Polygon, Box
- **Labels**
 - Marker, Pixmap Marker†
- **Surface modeling**
 - TriGrid, Mesh, TriMesh†, Polyhedron†

†New in 1.5

Geometric Primitives (*cont.*)

- **NURBs**
 - NURB Curve, NURB Patch
- **Conics and Quadrics**
 - Ellipse[†], Disk[†], Torus[†], Cylinder[†], Cone[†], Ellipsoid[†]

[†]New in 1.5

Flexibility

Geometries

Complexity vs. Flexibility

New 1.5 Geometries

Conics and Quadrics

Important Things To Know™

- **Generally, the axes should be orthogonal (all at 90-degree angles to one another)**
- **Non-orthogonal axes are permissible, and result in skewed objects**
- **Axes' relative lengths may be anything you want, which results in objects with elliptical cross-sections**
- **Skewed, elliptical cross-section objects are legal**

Conics and Quadrics

Non Orthogonal Axes

Conics—Future Directions

- **The uMin and uMax, and vMin and vMax, fields allow one to make partial object**
 - Hemispheres, truncated cones, etc.
- **This feature is not yet released**
 - In QuickDraw 3D 1.5 the min values must be set to 0 and the max values must be set to 1

Future Stuff—Post 1.5

- A partial Cylinder and a partial Cone

Conics—End Caps

- The “endCap” field allows one to place (or not place) end caps on the cone and cylinder
- When the partial objects are enabled, the “interior” cap, if set, will add a face over the cut-out section
 - i.e., you can make a partial ellipsoid look as if it were cut from a hollow ball if you specify no interior end cap, and from a solid ball if you do specify an interior end cap

Future Stuff—Post 1.5

- **Cylinders with and without end caps or interior end caps**

Conics—End Caps

1.5 Implementation

- **Currently, the only legal values are:**
 - **kQ3EndCapNone, kQ3EndCapTop, kQ3EndCapBottom, or (kQ3EndCapTop | kQ3EndCapBottom) for the cylinder**
 - **kQ3EndCapNone or kQ3EndCapBottom for the cone**
 - **kQ3EndCapNone for the ellipsoid and torus**

TriMesh and Polyhedron

- **Mesh introduced in 1.0 is repositioned as**
 - Free form geometry
 - For interactive authoring/manipulation
- **New geometries introduced to fill in the role previously reserved for the Mesh**
- **Both based on connected triangular faces, which share vertices and edges**

TriMesh and Polyhedron

- Both geometries provide for immediate and retained modes (the Mesh continues to be only retained)
- For both geometries, you have to do your own tessellation (i.e., breaking complex faces into triangles)
- Polyhedron makes use of the same AttributeSet that are used by all other geometries, the TriMesh uses a unique flat attribute model

So Which Do I Use?

Characteristic	Polyhedron	Trimesh	Mesh	Trigrid
<i>Memory usage</i>	very good	good	poor	very good
<i>File space usage</i>	very good	good	very good	very good
<i>Rendering speed</i>	good	very good	good	good
<i>Topological obj editing</i>	poor	impossible	very good	impossible
<i>Topological data struct. ed.</i>	fair	fair	impossible no data str.	impossible fx topology
<i>Geometric data structure editing</i>	very good	very good	impossible	very good

UV Picking

- Allows cool 3D painting on Objects
- See TextureEyes demo
- Sample app on the SDK—BoxPaint

File References

Allow references to 3D data across files

- End of monolithic and gigantic files
- Allows for caching of 3D data
- Reduces bandwidth and download time
- Ships as part of QuickDraw 3D 1.5

I/O File References

- You can reference one metafile from another metafile

Levels of Detail—LOD

- Same object represented by proxies at different levels of detail
- Distance to camera controls detail selection
- Far away objects render faster
- Implemented as a `DistanceProxyGroup`, a subclass of `DisplayGroup`
- Source code for this is on the conference CD

I/O: Group Traversal Control

“Diving into Groups”

```
typedef enum TQ3FileReadGroupStateMasks {
    kQ3FileReadWholeGroup          = 0,
    kQ3FileReadObjectsInGroup      = 1 << 0,
    kQ3FileCurrentlyInsideGroup    = 1 << 1
} TQ3FileReadGroupStateMasks;

typedef unsigned long TQ3FileReadGroupState;

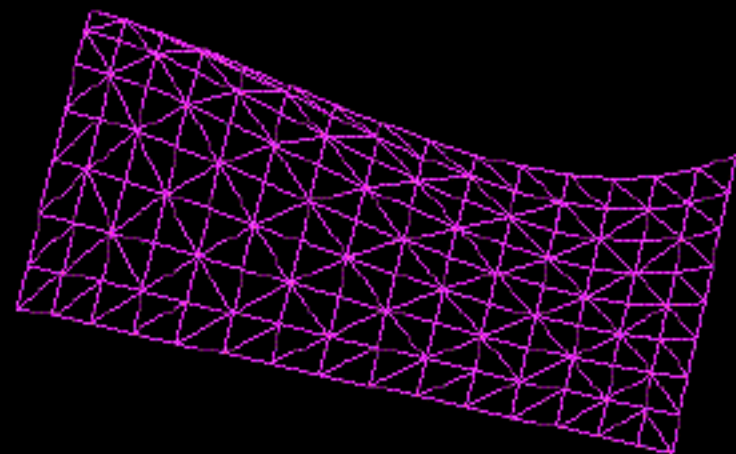

TQ3Status Q3File_SetReadInGroup(
    TQ3FileObject      file,
    TQ3FileReadGroupState readGroupState);

TQ3Status Q3File_GetReadInGroup(
    TQ3FileObject      file,
    TQ3FileReadGroupState *readGroupState);
```

Adaptive Tessellation

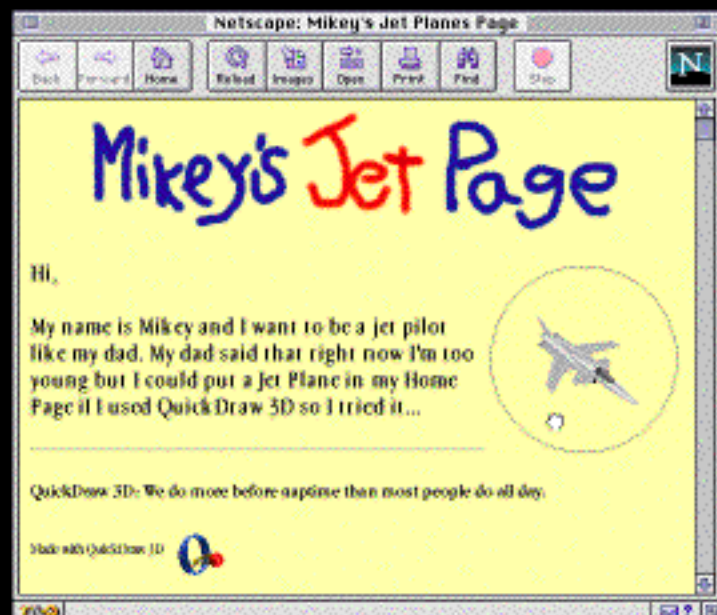

- Level of detail changes as object is moved “closer” to the camera location
- Will improve performance for:
 - NURB Patches
 - Conics and Quadrics

Netscape Plug-In

Now supports QuickDraw 3D 1.5

- On the QuickDraw 3D web site RSN
- Allows you to embed 3DMF in HTML

Viewer Improvements

- **The UI for the Viewer has been improved**
 - Better user interaction with the “virtual sphere”
 - Camera view pop-ups
 - Improved support for drag and drop
 - Improved control over drawing
 - New separate calls for control strip and content window
- **See develop issue 29 for more information**

QuickDraw 3D RAVE

“Renderer Acceleration Virtual Engine”

- **Low-level API**
 - Targeted at games, simulation, real-time applications
- **Hardware Abstraction Layer**
 - Hardware vendors write one RAVE driver
 - Software developers get acceleration on many cards for free
- **Very thin layer**
 - Hardware speeds with a software interface

RAVE Benefits

- Accelerates the rasterization and hidden surface removal (HSR) operations on 3D data including triangles, points, and lines
- Provides the fastest possible path to 3D hardware acceleration
- Provides the features that can run the most efficiently in hardware

RAVE Concepts

- **RAVE Manager**
 - Responsible for the loading of RAVE drawing engines and informing the application of all the available RAVE engines
- **Drawing Engine or RAVE Engine**
 - A shared library loaded by the RAVE Manager that implements the main RAVE drawing functions

RAVE Concepts

- **Draw Context**
 - A rectangular region on a device specified by the application and managed by a RAVE engine into which drawing occurs
- **Clipping Region**
 - A platform dependent mask that prevents pixels from being written into the frame buffer—used for maintaining the window system appearance

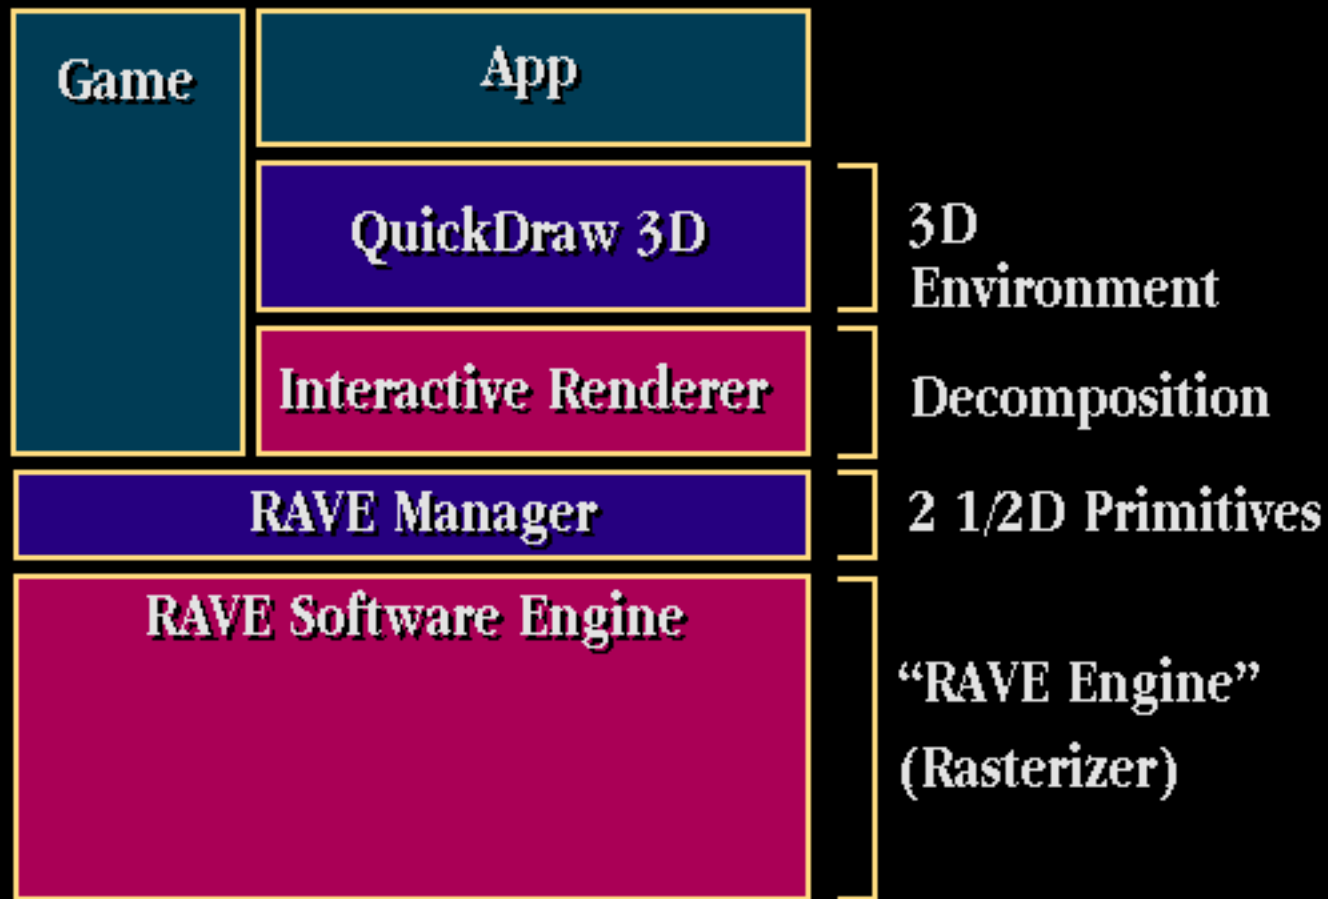

RAVE Features

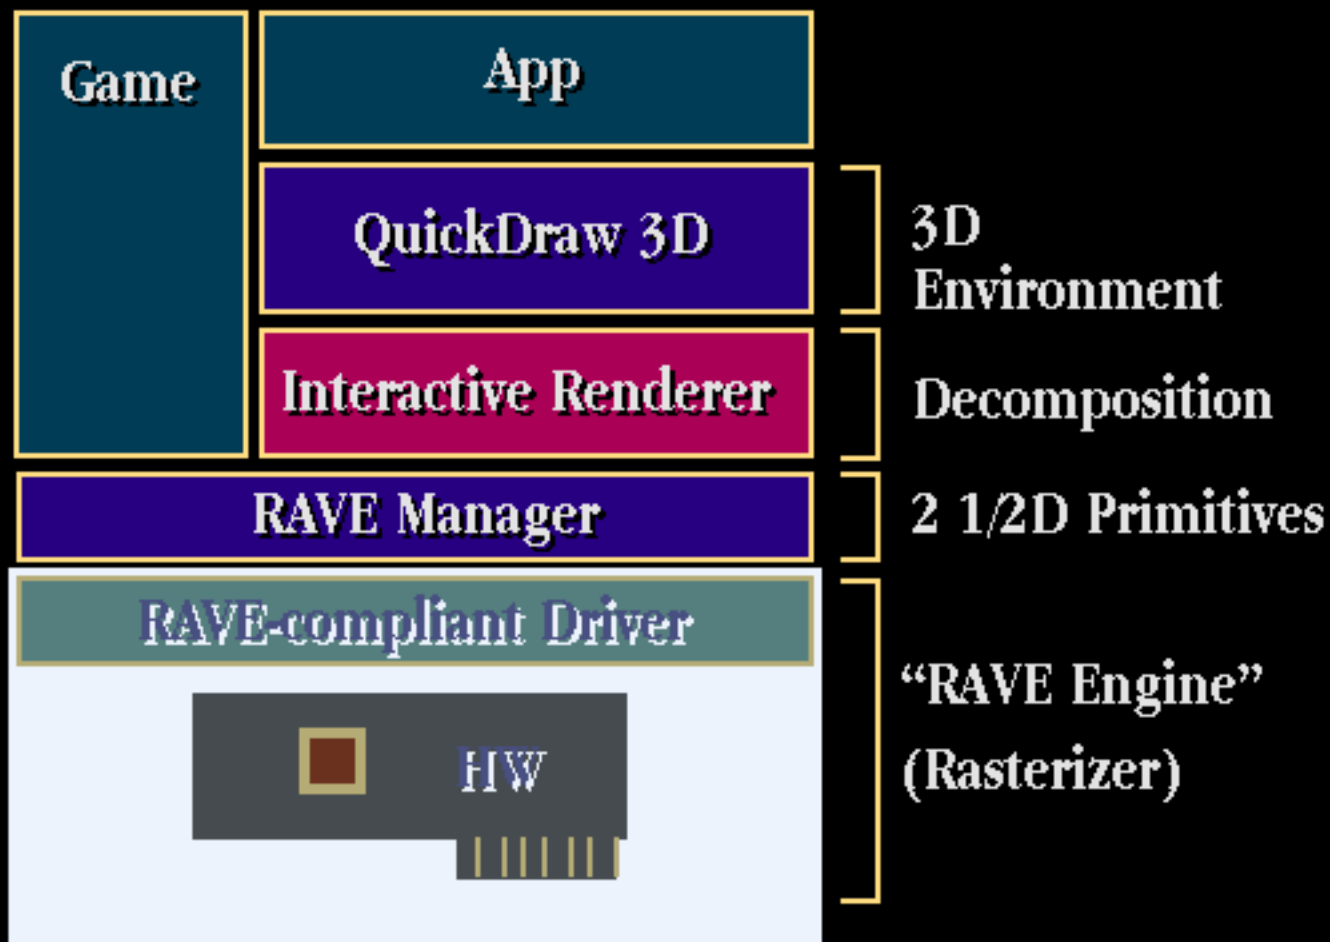

- **Gouraud Shading**
- **Perspective correct texture mapping with full diffuse and specular modulation per channel**
- **Support for ZBuffer/non-ZBuffering HSR algorithms**
- **Fast drawing primitives with full vertex sharing—TriMesh**
- **Wide variety of texture formats including CL8 and CL4**

RAVE Architecture

RAVE Architecture

What RAVE Does Not Support in 1.5

- Geometry processing
- Lighting model
- Geometric clipping
- Multiple monitors

Future of RAVE

These new features are under consideration

- **Single pass texture compositing**
- **Texture mipmap selection bias**
- **Fog**
- **Shadow volumes**
- **ZBuffer access, utilities**
- **Will be backward compatible**

Useful New API Calls for 1.5.1

- **Plug-in renderer support**
 - `Q3Renderer_IsInteractive`
 - `Q3Renderer_GetConfigurationData`
 - `Q3Renderer_SetConfigurationData`
 - `Q3RendererClass_GetNickNameString`

What's New in 1.5.1?

Bug Fixes!

- **Panes and Masks on Macintosh Draw Context**
- **Pixmap Draw Context now allows `kQ3PixelFormatARGB32` and `kQ3PixelFormatARGB16`**
- **ViewIdle and ViewIdleProgress methods**
- **Sorting Line pick hits**
- **Various Viewer bugs**
