

The background features a dark, textured surface with a glowing blue and purple sphere in the center. A white Apple logo is positioned at the top of the sphere. The text "Worldwide Developers Conference" is overlaid on the image. "Worldwide" and "Conference" are in a gold, serif font, while "Developers" is in a white, serif font inside a white rectangular box. The overall aesthetic is futuristic and tech-oriented.

WebObjects: Frameworks

Allen Denison

Apple Enterprise Software

Agenda

- **WebObjects as a Framework**
- **Building a Web Application**
- **Framework Specifics**
- **How it Works**
- **Summary**
- **Q&A**

A Definition of WebObjects

WebObjects is a collection of frameworks that facilitate the rapid development of sophisticated Web-based applications

What Is a Framework?

A Framework is a collection of classes that work together to solve specific problems in a particular domain

Why Frameworks?

Why Frameworks?

- **Apple concentrates on delivering a strong foundation**

Why Frameworks?

- **Apple concentrates on delivering a strong foundation**
- **Partners can build on that foundation**
 - **Tools (goLive's CyberStudio)**
 - **New Frameworks (Dover Pacific)**

Why Frameworks?

- **Apple concentrates on delivering a strong foundation**
- **Partners can build on that foundation**
 - Tools (goLive's CyberStudio)
 - New Frameworks (Dover Pacific)
- **Run on multiple platforms**

Why Frameworks?

- **Apple concentrates on delivering a strong foundation**
- **Partners can build on that foundation**
 - Tools (goLive's CyberStudio)
 - New Frameworks (Dover Pacific)
- **Run on multiple platforms**
- **Shared between Web and traditional apps**

Why Frameworks?

- **Apple concentrates on delivering a strong foundation**
- **Partners can build on that foundation**
 - Tools (goLive's CyberStudio)
 - New Frameworks (Dover Pacific)
- **Run on multiple platforms**
- **Shared between Web and traditional apps**
- **Developers don't have to write as much code—assemble and deploy**

Apple Frameworks

Apple Frameworks

- **Foundation**

- Data type objects, separation from OS, remote object support

Apple Frameworks

- **Foundation**

- Data type objects, separation from OS, remote object support

- **Application Kit**

- Traditional application UI objects

Apple Frameworks

- **Foundation**

- Data type objects, separation from OS, remote object support

- **Application Kit**

- Traditional application UI objects

- **Enterprise Objects**

- Object persistence (database connectivity)

Apple Frameworks

- **Foundation**

- Data type objects, separation from OS, remote object support

- **Application Kit**

- Traditional application UI objects

- **Enterprise Objects**

- Object persistence (database connectivity)

- **WebObjects**

- Web application specific objects

WebObjects Framework

Framework Specifics

Learn HTTP/HTML

Framework Specifics

Learn HTTP/HTML

- **HTTP Request Class**
 - Get browser type
 - Get incoming data's MIME content type
 - Get incoming data
 - Get HTML input form values by name
 - Get browser's cookies
 - Localized

Framework Specifics

Learn HTTP/HTML

- **HTTP Response Class**
 - Set response's MIME content type
 - Append HTML to response
 - Append raw data to response
 - Set other HTTP response headers
 - Authentication challenges
 - URL redirection, etc.
 - Set content encoding for localization

Framework Specifics

Learn HTTP/HTML

- **HTML Classes (Dynamic Elements)**
 - Template is parsed into tree of objects
 - Each HTML tag has its own representation: tag name, attributes, etc.
 - Objects know how to render themselves in HTML

Framework Specifics

Understand Server API/Headers
Learn HTTP/HTML

Framework Specifics

Understand Server API/Headers

- **HTTP Server Adaptor**
 - Converts HTTP requests into HTTP Request objects
 - Converts HTTP Response objects into Server API specific format
 - Source code is shipped with releases
 - Supports CGI, NSAPI, ISAPI, Web*, etc.
 - Load distribution and load balancing

Framework Specifics

Learn SQL/Build Queries

Understand Server API/Headers

Learn HTTP/HTML

Framework Specifics

Learn SQL/Build Queries

- **Database Connectivity Classes (EOF)**
 - Database independent
 - Supports Oracle, Sybase, Informix, and ODBC
 - Multiple databases can be used to populate the attributes of an object
 - Doesn't tie SQL code directly to UI
 - Same EOF objects used in both OPENSTEP and WebObjects

Framework Specifics

Generate HTML

Learn SQL/Build Queries

Understand Server API/Headers

Learn HTTP/HTML

Framework Specifics

Generate HTML

- **Dynamic Elements**
 - Attributes of HTML elements determined by variables and method calls at runtime
 - e.g., populate an HTML table as a response to a query
 - Display HTML based on conditional logic
 - Repetition construct

Framework Specifics

Manage User State

Generate HTML

Learn SQL/Build Queries

Understand Server API/Headers

Learn HTTP/HTML

Framework Specifics

Manage User State

- **Session State Management Classes**
 - **The Session Class**
 - Get/set session variables
 - Session knows how to serialize/deserialize itself
 - **Persistence: The SessionStore Class**
 - Saves and retrieves Session objects (for application and individual pages)
 - **Subclass (for flatfile or database storage)**
 - **Session timeout services**

Framework Specifics

- 
- Localize
 - Manage User State
 - Generate HTML
 - Learn SQL/Build Queries
 - Understand Server API/Headers
 - Learn HTTP/HTML

Framework Specifics

Localize

- **Localization Support**
 - Hash table maps English keywords into localized values
 - Localized icons, images and HTML templates
 - User's language preferences are stored in Session object
 - API is localization aware

Framework Specifics

Framework Specifics

Write Application

- **Application Development Support**
 - **Server side scripting**
 - Easy to learn
 - Rapid prototyping and application development
 - No compilation required
 - **Server side Java support**
 - Write entire application in Java
 - **Application Class**

Framework Specifics

Framework Specifics

Deploy

- **Deployment Support**
 - Load balancing and distribution
 - Deploy multiple instances of application on the same machine
 - Scale up by deploying on multiple machines
 - Deployment is configurable
 - Machines/instances can be added at run time without shutting down

Determining the Session

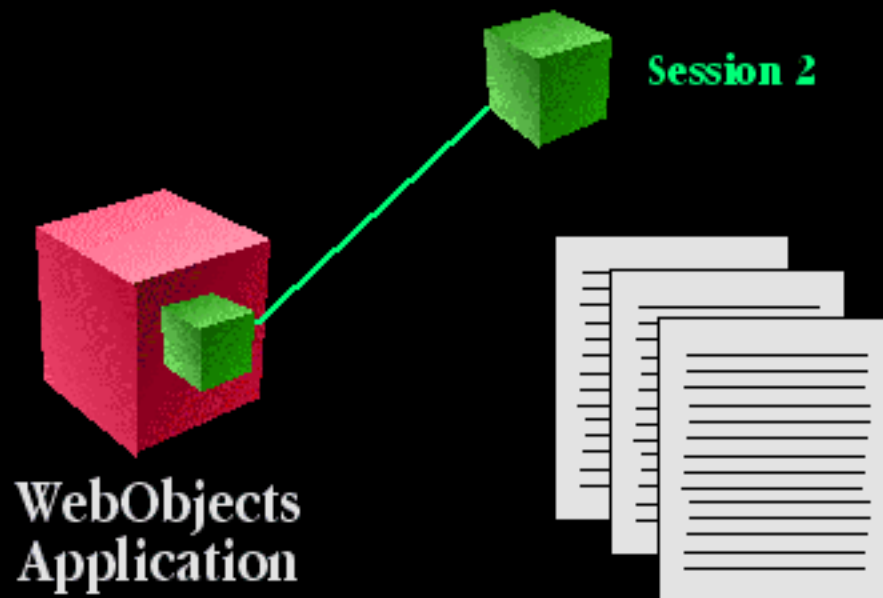

How it Works

Determining the Page

How it Works

Determining the Page

How it Works

- **Has three parts**
 - HTML Template
 - Server side logic
 - Declarations (bindings)
- **Receives and processes HTTP Request objects**
- **Generates HTTP Response objects**

A WebObjects Page

How it Works

HTML Template

```
<HTML>
<BODY>
<FORM>
<WEBOBJECT NAME=A>
<WEBOBJECT NAME=B>
</FORM>
</BODY>
</HTML>
```

Declarations

```
A: TextField {
    value=data;
}
B: SubmitButton {
    action=setData;
}
```

Logic

```
id data;

function setData {
    object=doIt();
    return object;
}
```

A WebObjects Page

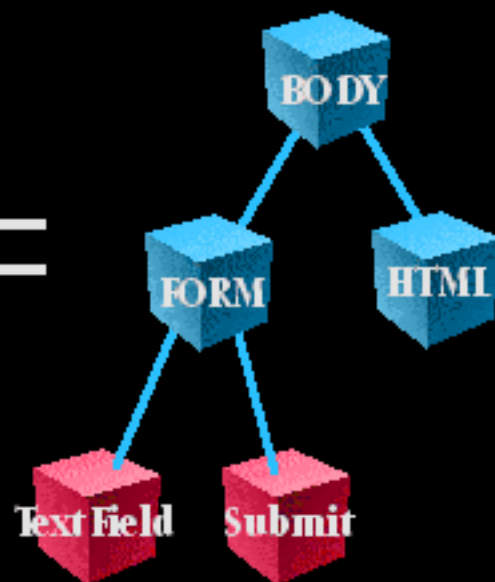

How it Works

```
<HTML>  
<BODY>  
<FORM>  
...  
</FORM>  
</BODY>  
</HTML>
```

+

```
A: TextField {  
    ...  
}
```

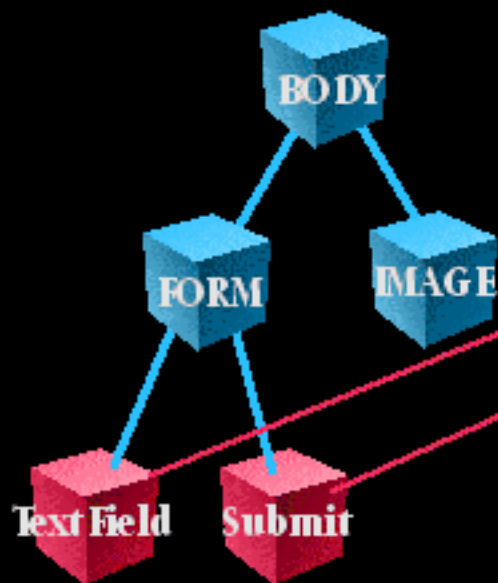

=

An Object Tree is Built

How it Works

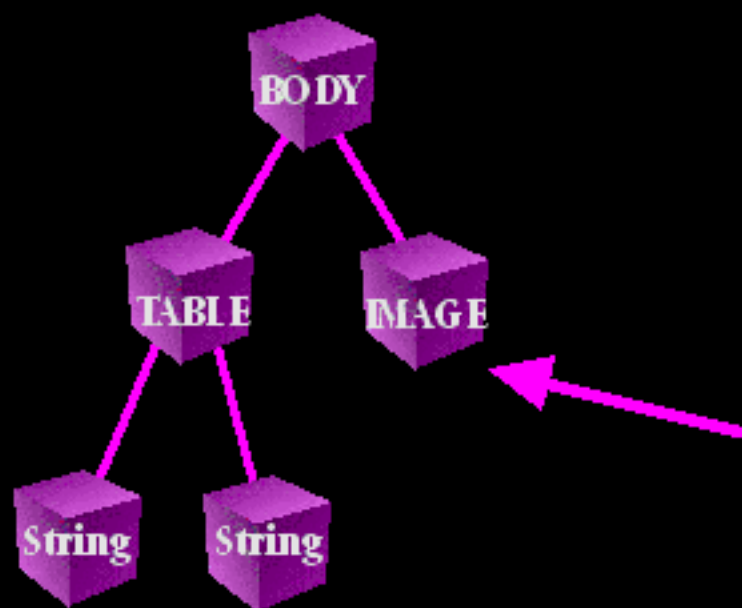

```
id data;  
  
function setData {  
    object=doIt();  
    return object;  
}
```

Code is Executed

How it Works

```
id data;  
  
function setData {  
    object=doIt();  
    return object;  
}
```

**New Tree is Built
Based on Code**
